ABSTRACT OF THE DISCLOSURE

A system for dynamic generation of images intended to be transmitted to at least one remote terminal, comprising a server ~~comprising~~. The server includes source images and ~~processing means for the generation~~ a processor for generating from ~~said~~ the source images of said images intended for ~~said~~ the at least one remote terminal into a format that is compatible with ~~said~~ the at least one remote terminal, ~~wherein said~~. The source images are vector images[[],]. The ~~the~~ description file of at least one of ~~said~~ the source images ~~comprising~~ includes a description of the characteristics of ~~said~~ the source image and at least one tag adapted to cause a manipulation of all or part of ~~said~~ the source image, ~~and wherein said~~. The system ~~comprises~~ means includes apparatus for generating a modified vector image from a source image by replacement of at least one tag by an instruction code in ~~said~~ the description file of ~~said~~ the source image.
